

TENTATIVE EECS 170A STUDY PLAN FOR FALL 2010

WEEKS	TOPICS	PAGES
0	Introduction	1-13
1	Energy bands Electrical conduction in solids Charge carriers in semiconductors and Concept of Hole Doping and extrinsic semiconductors Metals, Insulators and Semiconductors	23-40
2	Density of States Function Fermi statistics Semiconductors in equilibrium Intrinsic carrier concentration and Fermi level Charge Neutrality Band bending due to concentration and temperature	41-67
3	Carrier drift Mobility effects Conductivity and Resistance Carrier diffusion Graded doping and band bending and electric field	75-104
4	Semiconductor in equilibrium Carrier generation recombination Ambipolar transport Quasi Fermi Levels	120-136
5	P-N Junction Intro I-V Characteristics	195-208
6	P-N Junction diode Carrier distributions and current in p-n junction diode MIDTERM	215-221 235-240
7	Bipolar Junction Transistor (BJT) Basic principle Currents in BJT Modes of Operation	371-379
8	Ebers-Moll Model BJT Circuit analysis (additional material)	389-406
9	MOSFET Energy band diagram Flat-band voltage Threshold voltage I-V relationship	563-617
10	Basic MOSFET circuit operation MOSFET Additional material	
FINAL
